

Wrap Spring Clutches and Clutch/Brakes

Warner Electric

Founded in 1927, Warner Electric has grown to become a global leader in the development of innovative electromagnetic clutch & brake solutions. Warner Electric engineers utilize the latest materials and manufacturing technologies to design long life, easy-to-use clutches and brakes that provide improved accuracy and repeatability. Warner Electric offers the broadest selection of industrial clutches, brakes, controls and web tension systems available from a single manufacturer.

Reliable Warner Electric components are used in a wide range of markets including material handling, packaging machinery, food & beverage, elevator & escalator, turf & garden, agriculture, off-highway, forklift, crane and motion control. Applications include conveyors, lift trucks, wrapping machines, servo motors, capping equipment, combines, balers, baggage handling systems, military vehicles, hoists and lawn mowers.

VISIT US ON THE WEB AT **WARNERELECTRIC.COM**

CHECK OUT warnerelectric.com

warnerelectric.com now features our new interactive eCATALOG making it faster and easier to find and spec the motion control products you need.

Within the Warner Electric Interactive eCATALOG, you can start your search for basic components, such as clutches or brakes, and then quickly refine your search from hundreds of possibilities to one that meets your specific power transmission requirements for NEMA, input/output configurations and other factors. You can also download specifications and PDF pages or submit an RFQ for any of your selections.

Warner Electric

WRAP SPRING CLUTCHES AND CLUTCH/BRAKES

Warner Electric offers a complete line of standard wrap spring clutches and clutch/brakes, available for immediate delivery through our nationwide network of power transmission distributors. As the industry leader in clutch/brake technology you can count on Warner Electric for complete application assistance and after sale service.

CB Series Clutch/Brakes

Electrically actuated clutch/brake package. Designed for applications requiring a continuous rotational input that is converted into starting and stopping a load. Operate from either an AC or DC power source.

Super CB Series Clutch/Brakes

High performance clutch/brake packages feature extraordinary long life. Ideal for demanding applications involving continuous high cycle rates under heavy load conditions.

WSC Series Clutches

Basic design wrap spring clutches are mechanically actuated and require no electrical power. Available in three configurations for overrunning, start-stop and single revolution applications. Very compact. They deliver more torque than a friction clutch of the same size.

Wrap Spring Product Line

CB Series

Clutch/Brake Package

Each CB Series unit is a completely self-contained, packaged clutch/brake assembly designed to start and stop a load rapidly and accurately without any cumulative error. In fact, at speeds up to 1800 rpm, loads are started and stopped within $\pm 1/2^\circ$ per revolution. CB Series units are solenoid actuated with standard models available in 12, 24, or 90 VDC as well as 115 VAC configurations.

Accurate

Start and stop positioning can be maintained within $\pm 1/2^\circ$ at speeds up to 1800 rpm. The stop point is adjustable by using the adjustable control collar.

Self-Contained

Each CB Series unit is completely self-contained. Assembly and testing before shipment ensure reliable and trouble-free operation.

Interchangeability

The CB Series is completely interchangeable with other comparable clutch/brake packages.

Features

- ☐ CW or CCW rotation
- ☐ Anti-back: anti-overflow feature
- ☐ 12, 24 or 90 VDC, 115 VAC operation
- ☐ 1, 2 or 4 stop collars standard; special stop collars also available (up to 24 stops)
- ☐ Adjustable stop collar
- ☐ Six standard sizes
- ☐ Torque ratings from 25 lb.in. to 5000 lb.in.

SCB Series

Long Life Clutch/Brake

The Super CB Series is a high performance version of the standard CB Series, providing up to five times the life. The SCB Series is recommended for heavy-duty applications requiring maximum torque, high cycle rates and minimum maintenance. Like the CB Series, each Super CB Series unit is a complete, factory-assembled package, ready for installation.

Features

- ☐ Heavy duty design
- ☐ High cycle rate performance
- ☐ Long life - up to five times that of a standard CB model
- ☐ Three standard models
- ☐ Torque ratings up to 5000 lb.in.
- ☐ CW or CCW rotation
- ☐ Anti-back: anti-overflow feature
- ☐ 12, 24, 90 VDC or 115 VAC operation
- ☐ 1, 2 or 4 stop collars standard; special stop collars also available (up to 24 stops)
- ☐ Adjustable stop collars

WSC Series

Wrap Spring Clutches

WSC Series clutches are simple, mechanically actuated devices providing high torque in a compact design. Specific models are available for use as an overrunning/one-way clutch (Model O), as a start/coast-to-stop clutch (Model SS), or as a single revolution clutch (Model S).

Overrunning/One-Way (Model O)

This clutch continually drives the load. The load is allowed to overrun the input, should its speed exceed input speed. In the reverse direction the unit acts as a one-way clutch, preventing the load from backing up.

Start/Coast-To-Stop (Model SS)

The start/stop clutch is engaged until the collar that contains the spring tang is disengaged. Once it is stopped, the load is disengaged and coasts to a stop.

Start/Stop – Single Revolution (Model S)

Attaching one end of the spring to the output hub results in a single revolution clutch. The load is stopped through the spring to the collar. Precise non-cumulative error single revolution cycling is achieved. Braking torque equals 10% of the maximum torque rating.

Features

- ☐ Five standard sizes
- ☐ Torque ratings from 25 lb.in. to 2500 lb.in.
- ☐ Hub or shaft input
- ☐ Multiple stop collars
- ☐ Over-travel stop
- ☐ Anti-overflow
- ☐ Adjustable stop feature

Principle of Operation

The three basic components of the wrap spring clutch are the input hub, output hub, and spring. The inside diameter of the spring is slightly smaller than the outside diameter of the two hubs. Rotation at the input hub in the direction of the arrow engages the spring and positively locks the two hubs together. Adding a control tang enables the spring to be disengaged, allowing the input hub to overrun.

Combination Clutch/Brake

The control tangs are used to hold open the clutch or brake spring, which are wrapped in opposite directions. When the clutch and brake control tangs rotate with the input hub, the input hub and output shaft are engaged by the clutch spring. When the stop collar locks the control tang of the brake spring, it wraps down engaging the output shaft to the brake hub. The clutch spring unwraps at the same time, allowing the input hub to freely rotate.

Design Configurations

Overrunning (One Way Clutch)

When the input hub is rotated in the direction shown, the spring wraps down and engages the input to the output hub. When the input hub is stopped or reversed, the spring unwraps, allowing the output hub to overrun. These clutches can also be used for backstopping and indexing. In the backstopping mode, either the input or output hub is attached to a fixed member and the other hub on a rotating part. Rotation is permitted in one direction, but locked in reverse rotation. Indexing provides an accurate and smooth intermittent rotary output from reciprocating input in variable angular increments.

Start/Coast-To-Stop Clutch (Random Positioning)

In this mode, the control tang rotates with the input hub, thus the clutch is engaged. When the stop collar locks the control tang, the spring unwraps, allowing the output hub to coast while the input hub continues to run.

Start/Stop – Single Revolution Clutch

In this mode another control tang is added to the spring and fixed to the output hub. When the stop collar engages the control tang, the output hub will not overrun. Remember only a maximum of 10% of the load will be stopped with the single revolution clutch.

Application Examples

The features of wrap spring clutches and brakes; accuracy, repeatability, high torque-to-size ratio, low power consumption and long life make them an ideal solution for a wide range of motion control applications. Basic functions include overrunning, single revolution, random positioning start-stop, high cycle rate rapid start-stops and accurate, repeatable positioning.

Typical Applications

- ☐ Conveyors
- ☐ Rotary indexing tables
- ☐ Packaging equipment
- ☐ Bagging machinery
- ☐ Collators
- ☐ Cut-off machines
- ☐ Vending machines
- ☐ Copiers
- ☐ Food processing equipment
- ☐ Paper feeds
- ☐ Folders
- ☐ Material handling equipment
- ☐ Riveters, staplers and stitching machines
- ☐ Sorters
- ☐ Punch presses
- ☐ Textile machines
- ☐ Film and wire processing

Incline Conveyor

The **WSC Model O** mechanical wrap spring clutch provides maintenance free anti-backup protection for this incline conveyor. While the conveyor is running, the wrap spring is in overrunning mode, allowing the clutch's output to freewheel. When the conveyor drive power is removed, either intentionally or unintentionally, the spring holds the hub stationary and will prevent the conveyor and its load from back-driving.

Indexing Rotary Table

Each time the power supply provides a pulse to the solenoid of the Standard CB wrap spring clutch/brake, the table indexes one position for filling, labeling, sorting, staging or inspecting products. **CB, Super CB or WSC Model S** (with customer supplied actuator) units may each be used to perform the indexing function. Please note that while the graphic shows open gearing, a standard enclosed gearbox will work just as effectively.

Industrial Stitchers and Staplers

The motor drives a large flywheel and a cam connected to the stitcher head. The **CB** or **Super CB** wrap spring clutch/brake provides one complete cycle, always stopping at the same precise position in time for the next cycle. Warner Electric's CB and Super CB units never require any adjustment or lubrication, and provide non-cumulative error for cycle-to-cycle accuracy and consistency.

Print Head

In this printing application, a photoelectric sensor detects the registration mark on the web and signals the **CB** or **Super CB** clutch/brake to cycle. Each cycle drives the print wheel in registration with the continuously moving web material. Warner Electric wrap spring clutch/brakes provide start and stop positioning within a $\pm 1/2^\circ$ per revolution (non-cumulative), making them an excellent solution for applications requiring highly accurate, consistent performance.

Cut-Off Knife

As tubing material is fed, a sensor determines when the appropriate length has been reached, and signals the clutch/brake to cycle, driving the knife to cut the tubing to the correct length. This application shows a standard option two-stop collar, which indexes 180° per sensor input, making two cuts per one complete 360° revolution. The **CB** or **Super CB** clutch/brake provides error free indexing, making the reaction time for the knife consistent from cycle-to-cycle.

Rack and Pinion Indexing

The unidirectional **WSC Model O** operates as an indexing drive for this application. As the rack moves upward, the wrap spring clutch drives, providing torque to the in-feed rolls. When the rack moves downward, the wrap spring clutch freewheels, transmitting no torque to the rolls. Since the cam, pinion gear and rolls are all constant diameters, coupled with the accuracy of the WSC, the amount fed each cycle remains constant and consistent.

Selection

For Product Selection Follow 3 Easy Steps

Wrap spring clutches and brakes are pre-packaged, pre-assembled units which are as easy to select as they are to install. The simple three step selection process includes:

- Step 1** Determine the clutch or brake function
- Step 2** Determine size function (as on page 7)
- Step 3** Verify design considerations

This selection process is based on the assumption that the diameter of the shaft at the clutch or clutch/brake location has been designed through good machine design practice. For most applications, this process will determine the correct size product. When the performance requirements of a given application are marginally within the capabilities of a specific product, consider using the next larger size. In instances where

required load/speed performance data is known and unit size is uncertain, use the technical selection process starting on page 36 which will help you review the necessary aspects of your application.

Step 1

Determine clutch or brake function

Wrap spring clutches and brakes can perform three control functions—overrunning, start/coast-to-stop, and single revolution. Determine the function which will provide the best control for your application. Using the chart below, select the series which best fits your application requirements.

Step 2

Determine size

To select the correct size unit, determine the maximum rpm at which the clutch or brake will be operated and the

shaft diameter on which the wrap spring unit will be mounted. A wrap spring clutch engages almost instantly, and, since spring wrap increases with load, the unit must be sized carefully to insure that it is correct for the application. If there is any uncertainty regarding the correct unit size, we recommend using the technical selection process starting on page 36. To select the correct wrap spring unit, locate the corresponding speed and shaft diameter points on the appropriate chart on page 7. For applications requiring speed or diameter values higher than those illustrated, please contact your local Warner Electric Distributor, your Area Sales Manager, or Warner Electric Technical Support at (800) 825-9050.

Selection by Function

Function	Performance	Max. Torque				
		Wrap Spring Product	Starting lb. in. (N-m)	Stopping lb. in. (N-m)	Max. rpm	Actuation Method
Overrunning  Engaged in one direction only	An overrunning clutch will transmit torque in one direction only when the input hub is stopped or reversed. Consequently, the load is disengaged and free to rotate or overrun.	WSC Series Model O	2,500 (282.5)	N/A	1,800	Reverse input rotation
Start/Coast-To-Stop  Random Positioning	A start/coast-to-stop clutch will engage and disengage a load either by mechanical or electrical actuation. Start/coast-to-stop clutches provide a random stop position for the load.	WSC Series Model SS	2,500 (282.5)	0	1,800	Mechanical
Single Revolution  Accurate positioning for single or multiple stops	A single revolution clutch or clutch/brake will accurately position a load with no cumulative error for each single revolution cycle. Multiple stop collars with up to 24 stops (per revolution) provide fractional revolution capability.	WSC Series Model S	2,500 (282.5)	250 (282.5)	1,800	Mechanical
		Super CB	5,000 (565)	5,000 (565)	750	AC or DC Solenoid
		Standard CB	5,000 (565)	5,000 (565)	1,800	AC or DC Solenoid

Step 3

Verify design function considerations

Once the appropriate series and model size have been determined, review the design considerations. A complete checklist of these and other options available are detailed in the How to Order section for each series.

Design Considerations

All Models

- ☐ CW or CCW rotation
- ☐ Single or multiple stop collar
- ☐ Bore size

Super CB and CB Series

- ☐ AC or DC solenoid
- ☐ CB-5, CB-6, CB-8 and CB-10 available in the long life, Super CB Series (SCB). See pages 19–25 for specific details.

WSC Series

- ☐ Hub input/shaft output or shaft input/hub output
- ☐ Overrunning Model O, start/coast-to-stop Model SS or single revolution Model S

CB Mounting Requirements

While Warner Electric wrap spring clutches are self-contained, packaged products, which are easy to mount, a few simple precautions should be taken to ensure maximum life.

All Warner Electric wrap spring clutch products are designed to be installed in parallel shaft applications where they are fully supported by the shaft on which they are mounted.

Each clutch/brake backing plate assembly has three or four mounting holes, plus an anti-rotation slot, and is designed to serve as a torque arm rather than as a rigid mounting plate. The plate should be restrained from rotating by a pin or shoulder bolt, while allowing for the plate to float axially. The anti-rotation device must be capable of withstanding the braking torque required by the load.

Important: Do not rigidly mount unit. Plate must be allowed to "float" axially.

On CB type units, the input rotation is always connected to the input hub, and the output is always through the shaft through the hollow bore of the clutch/brake.

Connecting the unit to the parallel shaft may be accomplished by pinning (for sizes 4, 5 and 6 with 1 in. bore) or by key and set screw (for sizes 6 with 3/4 bore, 8 and 10). Size 2 uses a clamp collar.

When connecting the parallel shaft to the CB by using a belt, chain or gear drive, the input hub's radial bearing load capacity must not be exceeded. (See chart in next column). It may be necessary to counter bore or bearing

mount the input pulley sprocket or gear.

Maximum Radial Bearing Load at Maximum Speed

CB-2 = 7.5 lbs.

CB-4 = 14 lbs.

CB-5/Super CB-5 = 32 lbs.

CB-6/Super CB-6 = 63 lbs.

CB-8/Super CB-8 = 300 lbs.

CB-10/Super CB-10 = 500 lbs.

CB and Super CB style clutch/brakes are designed for horizontal shaft mounting. While it is possible to mount units vertically, vertically mounted units will see lower life than those mounted horizontally due to the wear between hubs resulting from gravity.

Horizontal Mounting

Figure 1 illustrates an ideal CB mounting. The unit is attached to the output shaft with both a key and set screws. The plate is restrained from rotating, but not from axial movement, reducing the side load on the CB's internal plate bearing.

In cases where easy access to the input is desirable, the clutch/brake can be mounted on a stub shaft. However, the unit must still be fully supported, while overhung loads on the input member must be avoided to maintain the life of the radial bearing.

Figure 1

Figures 2 and 3 illustrate alternate mounting configurations for achieving proper support. Inputs are usually face-mounted to the input hub of the CB unit as shown in Figure 1. This type of mounting is facilitated by the drilled and tapped holes provided in the free hub flange. The configuration shown in Figure 2 is a possibility, if the radial load on the input hub of the CB is small compared to the specified load.

Figure 2

If the application contains a substantial radial bearing load, arrange the pulley over the centerline of the clutch free hub as illustrated in Figure 3. Place one support bearing as close to the pulley as possible, using a torque arm for anti-rotation.

Figure 3

The smaller CB units (sizes 2, 4 and 5) have pilot holes in the output shaft, which guide drilling through the machine shaft for attaching the unit with a pin.

Vertical Mounting

When it is necessary to mount a unit vertically, mount it so the input hub is oriented in the upward position as illustrated in Figure 4.

Figure 4

Thread Engagement Requirements

Just a reminder . . . While mounting a sprocket or pulley to the input hub of your CB-2, CB-4, CB-5, CB-6, CB-8 or CB-10 the screws/bolts used must not protrude through the flange or hub. This will interfere or jam the control collar assembly, therefore causing the clutch to malfunction by failing to "drive" or causing the clutch to "slip." Please refer to the following chart for maximum thread engagement:

CB-2	= .150 in.
CB-4	= .280 in.
CB-5/Super CB-5	= .350 in.
CB-6/Super CB-6	= .312 in.
CB-8/Super CB-8	= .360 in.
CB-10/Super CB-10	= .500 in.

For further information and/or assistance, please call Warner Electric Technical Support at 800-825-9050.

CB Stop Collar Adjustment

CB Stop Collar Adjustment

Each CB and Super CB Series unit has an incrementally adjustable collar, which allows for changes to the output orientation.

To adjust the stop collar output orientation:

- Wrap the brake spring down completely by rotating the output shaft in the driving direction until it cannot travel any further;
- Remove the retaining ring from its groove and slide it forward on the sleeve; then,
- Hold the actuator clear, while sliding the stop cam off the sleeve. Rotate the cam to the desired stop position, and slide it back onto the sleeve; and,
- Slide the retaining ring back into position.

Adjustment Increments with Standard Stop Collars

CB-2	Infinitely Adjustable
CB-4	2.4° Adjustable
CB-5/Super CB-5	1.8° Adjustable
CB-6/Super CB-6	1.8° Adjustable
CB-8/Super CB-8	1.6° Adjustable
CB-10/Super CB-10	1.5° Adjustable

Combination Clutch/Brake Packages

CB Series clutch/brake combinations are designed for applications requiring a continuous rotational input being converted into starting and stopping a load. To start motion, the solenoid is pulsed, moving the actuator arm away from the control collar. This allows the clutch spring to wrap (wind) down onto the output assembly while the brake spring is unwinding, allowing the output to drive. Motion is stopped when the actuator returns to its rest position and the control collar rotates, stopping against the actuator. This forces the clutch spring to unwind releasing the input from the output and wraps the brake spring down, stopping the output. Anti-back and anti-overnun springs maintain position accuracy by eliminating any backward movement or bounce when stopped. The actual stopping position can be adjusted after installation by moving the splined cam of the control collar assembly.

The input hub is drilled and tapped to allow for mounting of sprockets, gears, sheaves, etc. The output is a hollow quill that mounts onto the customer's driven shaft. The backing plate is not a mounting plate. It must be held in place by a loose fit pin to eliminate any side or radial loads from preloading the unit's bearings.

Features

- ☐ Stop Position Accuracy $\pm 1/2^\circ$
- ☐ Adjustable Output Stop Positions
- ☐ Standard Features
 - CW or CCW Rotation
 - Hub Input – Shaft Output
 - Anti-Overrun Output does not overrun Input
 - Anti-Back Output does not Backup
- ☐ 1, 2 and 4 stop collars for 360° , 180° , and 90° output increments standard
 - Special multi-stop collars also available (up to 24 stops)
- ☐ 115 VAC and 24 VDC Solenoids Standard
 - Other Voltages Available
- ☐ Dimensionally Interchangeable with Competitive Units
- ☐ 5 Standard Models
 - CB-2
 - CB-4
 - CB-5
 - CB-6
 - CB-8
 - CB-10

CB Series Clutch / Brake

Specifications	CB-2	CB-4	CB-5	CB-6	CB-8	CB-10

Weight	1 lb.	2 lbs.	3 lbs.	7 lbs.	15 lbs.	29 lbs.

See page 36 for Minimum Inertia Requirements.
See page 8 for Mounting Examples.

Control Collars

These clutch/brakes (except CB-2) offer unique splined stop collars which can be adjusted radially in fine increments. This feature allows the user to reposition the output to comply with specified shaft and keyway placements. Standard stop collar positioning increments are shown below for all models:

CB-2	Infinitely Adjustable
CB-4	2.4° Adjustable
CB-5	1.8° Adjustable
CB-6	1.8° Adjustable
CB-8	1.6° Adjustable
CB-10	1.5° Adjustable

Optional Multiple Stop Collars

A one, two or four stop collar is standard on CB Series clutch/brakes. A variety of stop collar configurations, up to 24 stops maximum, are available. Consult Warner Electric Technical Support at 800-825-9050 for complete information.

Basic Selection

See pages 6–7 for basic product selection guidelines.

For complete Application Engineering information see pages 36–38.

How to Order

Order by part number (see chart on dimensions page) or specify as follows.

Specify:

- Series CB:
English
Metric
- Size: CB-2, CB-4, CB-5, CB-6, CB-8, CB-10
- Direction of rotation:
CW Clockwise
CCW Counterclockwise
- Coil voltage:
115 AC or 24 DC are standard
12 DC or 90 DC are options
- Bore size:
CB-2 = 1/4"
CB-4 = 3/8"
CB-5 = 1/2"
CB-6 = 3/4" or 1"
CB-8 = 1 1/4" or 1 1/2" standard
1" or 1 3/8" special order
CB-10 = 1 1/2" or 1 3/4" standard
1 1/4" or 1 5/8" special order
- Stop collar:
1, 2 or 4 stops standard
Other stop collars are available as specials

Example: CB-8, CCW, 115VAC, 1" bore, 4 stop collar

CB	-8	CCW	115VAC	1"	4
1	2	3	4	5	6

CB-2 Clutch / Brake

Dimensions in. (mm)

Bore Sizes

	Bore A	Pin Hole B	Mtg. Holes C	Set Screws D
English in. (mm)	.251-.253 (6.3655-6.4263)	.062 (1.5748)	3x #6-32 Eq. Sp. on .938 BC	#8 SHCS
Metric mm (in.)	6.0 H9 (.2362-.2374)	1.5 (.055-.062)	3x M4 x 0.7 Eq. Sp. on 23.83 BC	M4 x 0.7 SHCS

Maximum radial bearing load at maximum speed	500 lbs.
Maximum operating speed	200 RPM
Response time, voltage on at full speed	85 MS
Weight	29 lb.

Super CB Series Clutch / Brakes

Long Life, High Performance Design

The Super CB Series Clutch/Brakes function in the same manner as the standard CB Series. The major advantage of the Super CB Series is extraordinarily long life, up to five times longer than a standard unit. This makes the Super CB Series the ideal choice for applications involving high cycle rates and continuous heavy-duty operation.

Super CB Series design features

The standard CB Series and SCB Series units both employ three primary hubs that are oil impregnated; the input hub, the brake hub and an internal hub pinned to the output shaft. On standard units, the oil lubricates the bearing surfaces of the input and brake hub, while the Super CB Series uses needle bearings in the input and brake hubs to increase the radial bearing load capacity. Both types require oil in the hubs to lubricate the springs. The Super CB Series units also feature hardened steel wear rings on the primary hubs at the crossover point of the clutch, brake and shaft hubs to further increase life. The control collar assemblies are glass reinforced nylon, strengthened by steel or aluminum inserts. The actuators are Delrin, AF on all models.

Features

- ☐ Increased life-up to five times longer than standard models
- ☐ Stop Position Accuracy $\pm 1/2^\circ$
- ☐ Adjustable Output Stop Positions
- ☐ Standard Features
 - CW or CCW Rotation
 - Hub Input – Shaft Output
 - Anti-Overrun Output does not overrun Input
 - Anti-Back Output does not Backup
- ☐ 1, 2 and 4 stop collars for 360° , 180° , and 90° output increments standard
 - Special multi-stop collars also available (up to 24 stops)
- ☐ 115 VAC and 24 VDC Solenoids Standard
 - Other Voltages Available
- ☐ Dimensionally Interchangeable with Competitive Units
- ☐ 4 Standard Models
 - SCB-5
 - SCB-6
 - SCB-8
 - SCB-10
- ☐ High torque in small package
- ☐ Actuating solenoid is AC or DC operated
- ☐ Brake engages automatically when de-clutched
- ☐ Maintenance-free self-lubricating hubs are 18% oil by volume
- ☐ Hardened thrust washers on input and brake end
- ☐ Sintered metal hub offers easy machining for custom drive attachments
- ☐ Hardened and ground shaft
- ☐ Hub mounting holes for simple pulley or sprocket mounting
- ☐ Hardened crossover points on input, output and brake hubs provide increased life
- ☐ Steel tip insert on control cam collar
- ☐ Single or multi-stop collars available

Super CB Series Clutch / Brakes

Specifications	SCB-5	SCB-6	SCB-8	SCB-10
Static Torque	250 lb.in. (28.25 N-m)	500 lb.in. (56.5 N-m)	2,500 lb.in. (282.5 N-m)	5,000 lb.in. (565 N-m)
Maximum anti-override holding capability	125 lb.in. (14.125 N-m)	300 lb.in. (33.9 N-m)	600 lb.in. (67.8 N-m)	1,200 lb.in. (135 N-m)
Maximum anti-back holding capability	125 lb.in. (14.125 N-m)	300 lb.in. (33.9 N-m)	600 lb.in. (67.8 N-m)	1,200 lb.in. (135 N-m)
Inertia, rotating parts	.236 lb.in. ²	1.718 lb.in. ²	12.840 lb.in. ²	48 lb.in. ²
Maximum radial bearing load at maximum speed	35 lbs.	65 lbs.	300 lbs.	500 lbs.
Maximum operating speed	750 RPM	500 RPM	300 RPM	200 RPM
Response time, voltage on at full speed	27 MS	45 MS	50 MS	85 MS
Weight	3 lbs.	7 lbs.	15 lbs.	29 lbs.

See page 36 for Minimum Inertia Requirements.
See page 8 for Mounting Examples.

Control Collars

These clutch/brakes offer unique splined stop collars which can be adjusted radially in fine increments. This feature allows the user to reposition the output to comply with specified shaft and keyway placements. Standard stop collar positioning increments are shown below for all models:

SCB-5	1.8° Adjustable
SCB-6	1.8° Adjustable
SCB-8	1.6° Adjustable
SCB-10	1.5° Adjustable

Optional Multiple Stop Collars

A one, two or four stop collar is standard on SCB Series clutch/brakes. A variety of stop collar configurations, up to 24* stops maximum, are available. Consult Warner Electric Technical Support at 800-825-9050 for complete information.

*Note: 4 stop maximum with steel tip cam.

Basic Selection

See pages 6–7 for basic product selection guidelines.

For complete Application Engineering information see pages 36-38.

How to Order

Order by part number (see chart on dimensions page) or specify as follows.

Specify:

1. Series Super CB:
English
Metric
2. Size: SCB-5, SCB-6, SCB-8, SCB-10
3. Direction of rotation:
CW Clockwise
CCW Counterclockwise
4. Coil voltage:
115 AC or 24 DC are standard
12 DC or 90 DC are options
5. Bore size:
SCB-5: 1/2" standard
SCB-6: 3/4", 1" standard
SCB-8: 1 1/4", 1 1/2" standard
1", 1 3/8" special order
SCB-10 = 1 1/2" or 1 3/4" standard
1 1/4" or 1 5/8" special order
6. Stop collar:
1, 2 or 4 stops standard
Other stop collars are available as specials

Example: SCB-8, CCW, 115VAC, 1-1/4" bore, 1 stop collar.

CB	-8	CCW	115VAC	1-1/4"	1

Super CB-10 Clutch / Brake

For Airport Baggage Handling Conveyor Diverters

Designed to meet the rigorous demands of baggage handling conveyor diverters. Confined space for the drive system on the HSD (High Speed Diverter) dictate the wrap spring clutch-brake is vertically mounted with the input down. The AB (anti-backup) spring is removed to allow the paddles to be moved backward when luggage is jammed or caught between paddles.

Problems caused by this design criteria: removal of the AB spring and the weight of the timing pulley.

The other function of the AB spring is to keep the clutch spring unwound when the input is idling. The clutch spring can drag and overheat the input hub.

If the OEM bronze washer is missing or wears, the full weight of the pulley is supported by a snap ring that will wear into the pilot washer. Hubs will separate, then the AOR (anti-override) can unwind, and/or the brake spring up tang moves out of position in collar.

Features

- ☐ Thrust bearing supports weight of input timing pulley
- ☐ Oil reservoir wick
- ☐ Two teflon coated input collar washer
- ☐ Input hub dual row spread needle bearings
- ☐ Collar is aircraft grade aluminum
- ☐ Solid actuator link
- ☐ Large diameter actuator post
- ☐ Dimensional replacement for OEM product

SCB-10 Part Numbers

Model Number	Voltage	Part Number	Stops
CW	115 VAC	320-12-018A	1
CCW	115 VAC	320-22-020A	1
CW	220 VAC	320-12-019	1
CCW	220 VAC	320-22-021	1

Note; 300-12-072 (2-stop CW) older style does not have upgrades

Improvements

Thrust bearing supports weight of input timing pulley

- Eliminates bronze thrust washer
- Less heat is generated by thrust bearing versus friction from bronze washer
- Eliminates retaining ring wear into pilot washer

Oil reservoir wick in AB pocket

- Reservoir wick allows additional oil flow capacity into hubs

Two teflon coated input collar washers

- One tabbed to move with collar and other moves with input hub
- OEM has one washer that rotates with input hub wearing against large retaining ring and collar can drop
- More rigid versus single

Collar aluminum aircraft grade

- Versions of OEM design have sheet metal plates spiral clamped to collar
- Others have aluminum ring glued to plastic collar

Solid solenoid actuator link

- OEM uses pin that breaks or falls out due to high impact from solenoid

Fasteners that secure solenoid are #10

- #8 on OEM – more strength to withstand solenoid impact

WSC Series Clutches

Mechanically Activated, Basic Wrap Spring Clutch Design

WSC Series wrap spring clutches are mechanically actuated, eliminating the need for external electrical control devices. These simple, trouble free, easy-to-install clutches feature a high torque capacity in a small, compact package.

A choice of three different operating styles is available.

Features

- ☐ Five standard sizes
- ☐ Standard bore sizes from 1/4" to 1-1/2"
- ☐ Static torque rating from 25 lb.in. to 2500 lb.in.
- ☐ Mechanically actuated
- ☐ Choice of hub or shaft input
- ☐ 1, 2 or 4 stop collars standard
- ☐ Overtravel stop – Special
- ☐ Anti-overrun – Special
- ☐ Adjustable stop feature – Special
- ☐ Self-lubricating, no maintenance
- ☐ Simple mechanical actuation
- ☐ Easy-to-machine hubs readily adapt to application needs
- ☐ Single stop collars for single revolution operation multistops for less than one turn

Overrunning/One-Way (Model O)

(Model O) transmits torque up to the rated value in the positive direction, when disengaged it only transmits some drag torque in the reverse direction. Major applications for this unit are anti-overrun protection and anti-backup devices.

The load is allowed to overrun the input, should the load speed exceed the input speed. In reverse it acts as a one-way clutch, preventing reverse rotation.

Start/Coast-To-Stop (Model SS)

The start/coast-to-stop clutch (Model SS) accelerates the load just after the control collar has been released, thus the collar is free to rotate allowing the spring to grip both hubs together. To disconnect the clutch, the collar has to be restrained, stopping the collar from rotating via the stop face. The spring will then be opened and the clutch will be disengaged. The output is free to rotate and will be stopped by system friction and clutch drag torque.

The start/coast-to-stop clutch is engaged until the collar is stopped, which disengages the clutch allowing the load to coast to a stop.

Single Revolution (Model S)

The single revolution clutch (Model S) accelerates in the same manner as the model SS. The deceleration starts when the collar is restrained, and the spring is opened, disengaging the clutch.

For Model S, the brake torque capability is limited to 10% of the rated torque.

All WSC Series clutches are easy to install. The shaft can be pinned or, on larger units, delivered with keyways, a simple solution for applications requiring accurate positioning. One, two or four stop per revolution collars are available.

WSC Series Clutches

Specifications	WSC-2	WSC-4	WSC-5	WSC-6	WSC-8

Weight (lbs.)	0.13	0.22	0.62	2.60	8.25

See page 36 for Minimum Inertia Requirements.
See page 8 for Mounting Examples.

Optional Multiple Stop Collars

The WSC Series clutches feature a choice of collars with one, two or four stops as standard. Other stop collar configurations are available on special order.

Basic Selection

See pages 6–7 for basic product selection guidelines.

For complete Application Engineering information see pages 36–38.

How to Order

Order by part number (see chart on dimensions page) or specify as follows.

Specify:

1. WSC Series
2. Size: WSC-2, WSC-4, WSC-5, WSC-6, or WSC-8
3. Type of Operation:
S—Single revolution
SS—Start/Coast-To-Stop
O—Overrunning
4. Direction of rotation:
CW Clockwise
CCW Counterclockwise
(Direction of rotation is determined from the perspective of the input end.)
5. Hub input (HI) or shaft input (SI)
6. Standard Bore size:
WSC-2 = 1/4"
WSC-4 = 3/8"
WSC-5 = 1/2"
WSC-6 = 3/4" or 1"
WSC-8 = 1 1/4" or 1 1/2"

7. Stop collar:

Standard Stops: 1, 2 or 4

Example: WSC-6, S, CCW, HI, 1" bore, 4 stop collar.

Power Supply Units

One Shot Octal Socket Power Supply Model WSCC-102

Warner Electric's One Shot Power Supply is a plug-in clutch/brake control designed for operation of AC or DC wrap spring clutches and brakes with a D-frame coil. The One Shot provides a single voltage pulse of 160 or 325 VDC for approximately 20MS, whether the customer supplied switch is momentarily closed or held closed.

The One Shot Power Supply is UL Listed when used with Warner Electric's octal socket, part no. 6001-101-001, or DIN rail mount octal socket, part no. 6001-101-002 (each purchased separately) and only UL-Recognized when used with other sockets. This unit may be mounted in any convenient position using the two mounting holes provided on the socket.

Actuating the single pole, double throw (SPDT) switch energizes the solenoid coil. Releasing or resetting the switch charges an internal capacitor. A minimum of 20 milliseconds cycle time is required between operations.

Note: Designed for use with actuator limit stop option.

One Shot
Octal Socket Control
P/N 901-00-019

Specifications

Input:	120/240 VAC, 50/60 Hz
Output:	160/290 VDC Peak, 3 amps max at 160 VDC output, 5 amps max. at 290 VDC output
Ambient Temperature:	+ 32° F to + 122° F 0° C to + 50° C

For use with D-Frame coils only.

One Shot Power Supply
Model WSCC-101

The One Shot Power Supply is available for use with standard AC as well as DC D-Frame coils. The one shot provides a single overexcite voltage pulse whether the switch is momentarily closed, or held closed. The unit operates on either 120 or 230 AC, 50/60 Hz power and may be mounted in any convenient position by use of two mounting holes for #8-32 screws.

Note: Designed for use with actuator limit stop option and D-Frame coil.

Connection Diagram

Actuating the single pole, double throw (SPDT) switch energizes the solenoid coil. Releasing or resetting the switch charges an internal capacitor. A minimum of 20 milliseconds cycle time is required between operations.

CB Spring Differential Setting

CB Spring Differential Setting

All CB and Super CB Series clutch/brakes are factory-set to the proper spring differential overtravel. If a spring must be replaced, prior to disassembly, make sure the two spring tang slots are marked to help ensure proper reassembly. (There should be punch marks from the factory on either side of the spring tang slots marking those used for the correct differential setting.) If the slots are unmarked and the unit has been disassembled, use the following procedure to reset the spring differential.

1. Remove the retaining ring from the input hub.
2. Rotate the clutch so the brake spring is fully wrapped down by rotating the output shaft in the driving direction until it cannot travel any farther.
3. With the brake fully engaged (per step 2), pull the input hub assembly out, and pull the clutch spring tang out of its slot, allowing it to jump to wherever it comes to rest.
4. Unwrap the clutch spring and push it backwards into the nearest slot.
5. Push the input hub back into place, release the actuator, and rotate the clutch until the brake spring fully wraps down again.
6. With the brake fully engaged (wrapped down per step 2), hold the shaft with one hand and release the actuator. The stop collar will rotate forward as the brake is released and the clutch engages.

7. Measure the overtravel, use calipers to measure the distance between the tip of the actuator, and the tip of the stop on the cam.

The Amount of Acceptable Overtravel Varies with the Size of the Unit

CB-2	.09 to .19"
CB-4	.09 to .19"
CB-5/Super CB-5	.09 to .19"
CB-6/Super CB-6	.22 to .38"
CB-8/Super CB-8	.39 to .60"
CB-10/Super CB-10	.60 to .75"

8. If the overtravel measurement is within these specified limits, reinstall the retaining ring and the unit's overtravel is reset.
- 9 A. If the overtravel exceeds the specified limit, move the brake spring backwards one slot (against the direction of rotation) and repeat steps two through seven.
- B. If the overtravel is less than the specified limit, move the brake spring forward one slot (in the direction of rotation,) and repeat steps two through seven.

If Spring Replacement Is Not Required

If the unit is disassembled and the drive and/or brake springs do not need to be replaced, proceed as follows:

- Reposition the drive and brake springs into their original positions onto the output shaft assembly.
- Reassemble the clutch, and position the spring tangs of the drive and brake springs in the factory marked locations on the control collar assembly (on the control collar, the designated tang slots are indicated with punch marks on either side of each slot).
- After the unit is completely reassembled, the differential setting should match that of the original factory setting.

CB Actuator Gap Adjustment

Actuator gap is factory set and does not require adjustment at installation, only when replacing solenoids.

Push collar sleeve toward actuator while bottoming plunger into solenoid. Do not push on actuator.

Adjust gap to .020 / .030 inch for all sizes except CB-10 gap .040 / .060 inch.

Note: If a multiple stop the cam height will vary, measure over the highest cam.

Tighten solenoid adjustment screws. Measure gap to verify .020 / .030 inch, readjust if required.

Note: AC - Solenoids — If plunger does not bottom in solenoid it will overheat when energized.

Tighten solenoid adjustment screws. Measure gap to verify .020 / .030 inch, readjust if required.

Note: AC - Solenoids — If plunger does not bottom in solenoid it will overheat when energized.

Optional Actuator Limit Stop (ALS)

After setting gap with plunger bottomed in solenoid, slide limit stop post in slot until it comes in contact with back of actuator and does not reduce the actuator gap. Move post slightly away from actuator, tighten and verify gap is correct. Sizes 4 and 6 have an eccentric bar that is rotated to adjust.

CB-8 Shown - Layout of unit and optional ALS will vary by size

Optional ALS (Actuator Limit Stop) style will vary by size

Selection Considerations

Application Analysis

1. Function

The process for establishing the clutch or brake function is illustrated in Step 1 on page 6. In review, the three functions and the appropriate series selections are noted below.

Overrunning (One Way Clutch)

Unidirectional torque transmission with free wheeling in opposite direction.

Selection

WSC (Model O)

Start/Coast-to-Stop (Random Positioning)

Engage/disengage with random stop position.

Selection

WSC (Model SS)

Start/Stop (Single Revolution)

Accurate stop position in single or fraction revolution cycles.

Selection

WSC (Model S)

Standard CB

Super CB

2. Calculate load inertia (WR²)

Use the inertia chart on page 37 to determine the inertia of the application components. To determine WR² of a given shaft or disc, multiply the WR² from the chart by the length of shaft or thickness of disc in inches. Note: For hollow shafts, subtract WR² of the I.D. from the WR² of the O.D. and multiply by length.

In order to calculate the inertias of components which are made of material other than steel, use the multipliers found in the conversion chart (right) to establish the inertias of these components.

For applications involving machined parts or reflected rotational or linear inertia, please refer to the inertia discussion in the Application Engineering section of Warner Electric's Packaged Electromagnetic Clutches/Brakes Catalog, P-1234.

Inertia Conversion Chart

In order to determine the inertia of a rotating member (shaft, disc, etc.) of a material other than steel, multiply the inertia of the appropriate steel diameter from the chart on page 37 by:

Material	Multiplier
Bronze	1.05
Steel	1.00
Iron	.92
Powdered Metal Bronze	.79
Powdered Metal Iron	.88
Aluminum	.35
Nylon	.17

Torque vs. Model Comparison

Selection Considerations

3. Determine clutch or brake torque value

With the inertia value calculated in Step 2, determine the torque requirement for the function determined in Step 1.

A) For Overrunning and Start-Stop (random start-stop) (WSC Models SS and O)

$$T = \frac{WR^2 \times \text{RPM}}{3700 \times t} + \text{friction torque}$$

Where—

T = Torque required from wrap spring

WR^2 = load inertia (Step 2)

RPM = shaft speed at clutch location

t = time to engagement (.003 for clutch)

B) For single revolution applications (CB and WSC Model S)

$$T = \frac{WR^2 \times \text{RPM}}{3700 \times t} - \text{friction torque}^*$$

Where—

T = torque required from wrap spring

WR^2 = Load inertia (Step 2)

RPM = Shaft speed at clutch or brake location

t = time to disengagement
(.0015 for brake)

Find the value of T on the Torque vs. Model Comparison Chart on page 36.

*Frictional (drag) torque is the torque necessary to overcome static friction. It may be measured by a spring-scale or by dead-weights, applied to a known moment arm so gradually as to make inertia negligible. It is that torque found just sufficient to induce motion.

4. Verify selection with unit inertia

From the individual product specifications find the unit inertia of the model selected in Step 3. Add this to the load inertia previously determined to arrive at the total torque requirement.

A) For Overrunning and On-Off (WSC Models SS and O)

$$A) T_t = \frac{(WR^2_{\text{LOAD}} + WR^2_{\text{UNIT}})\text{RPM}}{3700 \times t} + \text{friction torque}$$

B) For Single Revolution Start-Stop (CB, Super CB and WSC Model S)

$$B) T_t = \frac{(WR^2_{\text{LOAD}} + WR^2_{\text{UNIT}})\text{RPM}}{3700 \times t} - \text{friction torque}$$

Where— T_t = total system torque

(WR^2_{LOAD}) = load inertia

(WR^2_{UNIT}) = clutch inertia

Find this new torque value on the Torque vs. Model Comparison Chart on page 36 to verify the model selected in Step 3.

Minimum Load Inertia—

Super CB and CB Clutch/Brakes

In order to achieve the CB accuracy capability of $\pm 1/2^\circ$, a minimum load inertia is required to fully engage the brake spring and disengage the clutch spring. This minimum inertia (I) can be calculated from the accompanying formula and chart:

$$I = \frac{(t)(T_c + T_o)(3700)}{\text{RPM}} - I_c$$

I = Minimum inertia required to fully activate the clutch/brake—lb.in.²

t = Time—Seconds

T_c = Torque required to fully activate the clutch/brake—in.lb.

T_o = Drag torque—in.lb.

RPM = Revolutions per minute

I_c = Inertia at the output side of the clutch—lb.in.²

Example: CB-6 in a system running at 200 RPM with 3/4" bore and 20 in.lb. drag. What inertia is required to fully activate the clutch/brake?

$$I = \frac{(0.005)(8.75 + 20)(3700)}{(200)} - 1.221 = 1.438 \text{ lb.in.}^2$$

Note: When calculated inertia is zero or negative, no further action is required. If the calculation result is positive, additional inertia equal to or exceeding the result should be added.

How to determine maximum inertia load of CBs

$$\frac{T \times 3700 \times t}{\text{RPM}} = WR^2$$

$$T = \text{Clutch Torque}$$

$$t = .0015$$

For CB and SCB Series units, these are the most commonly requested parts – other voltages (such as 12VDC and 90VDC), bores and stop collars are available.
 For the WSC Series, other units offering different bores, and overruning or start/coast-to-stop operation are available.
